                                                                                                                                                                                                                    Zhu X., Naz R.K.;

"Expression of a novel isoform of cyclin I in human testis.";

Biochem. Biophys. Res. Commun. 249:56-60(1998).

-I TISSUE SPECIFICITY: Highest levels in adult heart, brain and skeletal muscle. Lower levels in adult placenta, lung, kidney and pancreas. Also high levels in fetal brain and lower levels in fetal lung, liver and kidney. Also abundant in testis and thyroid.

-I DYSTOPMENTAL STAGE: Expression is independent of the cell cycle in lung fibroblasts.

-I SIMILARITY: Belongs to the cyclin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

CAPALYTIC ACTIVITY: Diphosphate + H(2)0 = 2 phosphate.
CAPALYTIC Addressium and potassium (By similarity).
SUBUNIT: Homodimer (Potential).
SUBUNIT: Homodimer (Potential).
SUBUNIT: Homodimer (Potential).
SUBILIARITY: Belongs to the H(+)-translocating pyrophosphatase (TC 3.A.10) family. Subfamily 1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  tetanus disease.";
Proc. Natl. Acad. Sci. U.S.A. 100:1316-1321(2003).
-!- FUNCTION: Generates a proton motive force; it probably catalyzes a
fully reversible reaction, thus being able to synthesize
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               "The genome sequence of Clostridium tetani, the causative agent of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      -!- CATALYTIC ACTIVITY: Diphosphate + H(2)O = 2 phosphate.
-!- COFACTOR: Magnesium and potassium (By similarity).
-!- SUBMIT: Homodimer (Potential).
-!- SUBCELLUIAR LOCATION: Integral membrane protein (Probable).
-!- SIMILARITY: Belongs to the H(+)-translocating pyrophosphatase (TC 3.A.10) family. Subfamily 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MEDLINE=22457253; PubMed=12552129; DOI=10.1073/pnas.0335853100; Brueggemann H., Baeumer S., Fricke W.F., Wiezer A., Liesegang H., Decker I., Herzberg C., Martinez-Arias R., Merkl R., Henne A., Gottschalk G.;

                                                                                                                                                                                                                                                                                                                                      CATALYTIC ACTIVITY: Diphosphate + H(2)O = 2 phosphate. COFACTOR: Magnesium and potassium (By similarity). SUBUNIT: Homodimer (Potential). SUBCELLUIAN LOCATION: Integral membrane protein (Probable). SIMILARITY: Belongs to the H(+)-translocating pyrophosphatase (TC 3.A.10) family. Subfamily 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pfam; PF03030; H PPase; 1.

This CDS has been cloned without stopcodon.
The CDS has been inserted into pDONR201 via a BP Clonase(TM) reaction. Additional sequence has been added in front of the start codon: att. AAAAAA GCA GGC TCC ACC (ATC).
The last codon is followed by the 3' att site: GACCCAGCTTTCTT. att The clone is validated by full sequence check.
Compared to the reference sequence NM 006835 (GI:17738314) we found AA exchange(s) at position (first base of changed triplet):

Human nucleic acid fragments, isolated from brain adrenal tissue, the placenta or bone marrow comprise any of: (A) a sequence selected from (AAQ76401-0477613), (B) an allelic variation of a sequence as described in (A), or (C) a sequence complementary to (A) or (B). (Updated on 25-MAR-2003 to correct PN field.)

Classifying an ovarian tumor as a BRCA-1-like or BRCA-2-like or non-BRCA-like tumor by determining a pattern of expression in the ovarian tumor of several markers.
      New breast cancer-associated (BCA) genes and polypeptides, useful for preventing, treating, diagnosing or staging breast cancer, or other BCA-related disorders, e.g. prostate cancer, sarcoma, Ewing's tumor, leukemia
                                                                                                                  The invention relates to human breast cancer-associated (BCA) genes and polypeptides. BCA sequences are useful for preventing or treating breast cancer. Other BCA-related disorders that may be treated include allergy, bone disease, eating disorder, infectious disease, ovarian cancer, prostate cancer, skin cancer or brain cancer, malignant or non-malignant tumnours, sarcoma, Ewing's tumnour, leukaemia, lymphomas, or polycythaemia vera. BCA sequences are also useful in forensic biology, diagnostic assays, prognostic assays or pharmacogenomics or for monitoring clinical trials. The invention is useful in gene therapy and as vaccines. pattern of expression in the ovarian tumor of several markers given in the specification; and (2) comparing a similarity of the pattern of expression of the markers in the ovarian tumor to a pattern of expression of the markers in a comparison tissue of a known BRCA-1-like or BRCA-2-like or non-BRCA-1-like or BRCA-1-like or BRCA-1-like or BRCA-1-like or BRCA-1-like or BRCA-1-like or non-BRCA-like tumor. This sequence corresponds to an ovarian cancer -related gene having an altered pattern of expression in ovarian cancer -related gene having an altered pattern of expression in ovarian cancer of the sequence data obtained in electronic format from WIPO at the printed specification but was ftp.wipo.int/pub/published_pct_sequences).

The invention relates to polynucleotides encoding colon tumour proteins. The polynucleotides and encoded polypeptides are useful in pharmaceutical compositions, such as vaccines, for the diagnosis, prevention, and treatment of colon cancer. Polynucleotide sequences may be used as hybridisation probes or primers, and in the design and preparation of priories for inhibiting expression of tumour polypeptides and proteins in tumour cells. The compositions are useful for stimulating an immune response against cancer, particularly for the immunotherapy of

Claim 1; SEQ ID NO 1413; 147pp; English.

```
The invention comprises compositions used for the therapy and diagnosis of ovarian cancer. The compositions comprise one or more ovarian tumour proteins, their associated polynucleotides, or immunogenic portions of the proteins. The ovarian tumour polynucleotides and polypeptides are useful for stimulating and/or expanding T cells specific for a tumour protein. They are also useful for inhibiting the development of cancer in a patient with an ovarian tumour DNA or protein by incubating isolated T-cells allowing them to proliferate, and administering to the patient. The sequences can be used as markers for cancer, for example, to monitor ovarian cancer progression. Probes and primers are useful in nucleic acid hybridisation, in detecting the presence of complementary sequences in a given sample, for preparing mutant species and for preparing other represent human ovarian tumour protein cDNA clones
colon cancer, and as markers for the progression of cancer. ABK4450-ABK46237 represent coding sequences of human colon tumour proteins of the invention. Note: With the exception of SEO ID No 1 and 2, the sequence data for this patent did not form part of the printed specification but was supplied by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New polynucleotides encoding ovarian tumor proteins, useful for treating ovarian cancer, and as probes, primers, and markers of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Immunogenic protein; cancer; ovarian tumour; T-cell stimulation; ss; gene therapy; cytostatic; T-cell expansion; nucleic acid hybridisation; primer; probe.
                                                                                                           U; 0 Other;
                                                                                                                                                                                                                                                                                                                                          436 GAAGATAATGTCTCAGAAAATGTGGGGTTCTGTGTGTGGCACT 395

                                                      AAH82377 to AAH83878 represent human ovarian tumour-associated polynucleotide sequences which encode ovarian tumour proteins. The ovarian tumour protein and polynucleotide sequences have cytostatic activity, and can be used in gene therapy and vaccine production. The ovarian tumour proteins and polynucleotides can be used to inhibit the development of cancer, particularly ovarian cancer. They can also be used to diagnose the onset and progression of cancer
                                                                                                                                                                                                                                                                                                                                            Human ovarian tumour associated polynucleotide sequence SEQ ID NO:1340.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel ovarian tumor proteins, and nucleic acids encoding them, used treat and diagnose cancers, particularly ovarian cancer.

The invention relates to a method of classifying an ovarian tumor as a BRCA-1-like or BRCA-2-like or non-BRCA-like tumor by: (1) determining a pattern of expression in the ovarian tumor of several markers given in the specification; and (2) comparing a similarity of the pattern of expression of the markers in the ovarian tumor to a pattern of expression of the markers in the ovarian tumor to a pattern of expression of the markers in the ovarian tumor to a pattern of expression of the markers in a comparison tissue of a known BRCA-1-like or BRCA-1-like or DRCA-like tumor. The method is useful for classifying an ovarian tumor as a BRCA-1-like or BRCA-2-like or non-BRCA-like tumor. This sequence corresponds to an ovarian cancer -related gene having an altered pattern of expression in ovarian cancer. (Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from WIPO at

The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated cancer associated nucleic acids and polypeptides - isolated using sera from cancer patients, used to develop products for the diagnosis, monitoring or treatment of cancers.
                                                                                     Cancer associated antigen; diagnosis; research; treatment; human; breast cancer; colon cancer; gastric cancer; renal cancer; lung cancer;

(INCY-) INCYTE CORP. (BURR/) BURRILL J D.

WPI; 2004-330172/30. P-PSDB; ADN01131.

New isolated polypeptides associated with cell growth, differentiation and death, useful for diagnosing, treating or preventing e.g. atherosclerosis, psoriasis, cancers, Alzheimer's disease, AlDS, anemia, diabetes mellitus or infertility.

Claim 5; SEQ ID NO 40; 213pp; English

death The invention comprises the amino acid and coding sequences of human proteins that are associated with cell growth, differentiation, and death (CGDD). The DNA and protein sequences of the invention are useful for diagnosing, treating or preventing disorders associated with aberrant expression of CGDD, such as: cell proliferative disorders (e.g. arteriosclerosis, atherosclerosis, bursitis, cirrhosis, hepatitis, polycythaemia vera, psoriaais and cancers), developmental disorders (e.g. Cushing's syndrome and hypothyroidism), neurological disorders (e.g. epilepsy, stroke, Alzheimer's disease, pick's disease, Huntington's disease, Parkinson's disease and multiple sclerosis), autoimmune/inflammatory disorders (e.g. AIDS, allergies, anaemia, asthma, contact decrmatitis and diabetes mellitus), and reproductive disorders (e.g. infertility, endometriosis and uterine fibroid). The present DNA sequence encodes a human CGDD-associated protein of the invention.

Sequence 903 BP; 247 A; 202 C; 201 G; 253 T; 0 U; 0 Other;

This sequence is the human Cyclin I nucleotide sequence. Cyclin I is expressed at almost constant levels throughout the cell cycle, and is corpressed at almost constant levels throughout the cell cycle, and is control. Cycling form complexes with cyclin-dependent kinases. CDK2, control. Cycling form complexes with cyclin-dependent kinases. CDK2, cyclin-dependent kinases. CDK2, complexes of the CDK2 protein with other proteins, selected from cyclin I, EM, bRReq. hsReq. and hsReq. and hsReq. and is privatal for GI/S late in G1 or early in S phase of the cell cycle, and is pivotal for GI/S transition. Compositions containing a CDK2 complex, an antibody targeting CC the complex, and nucleotide sequences encoding CDK2 or its derivatives can be used to treat diseases or disorders associated with increased or decreased levels of the complex. Screening the complex, or a derivative con a modulator of the complex. Screening the complex, or a derivative cor a modulator of the complex for neoplastic activity by measuring the complex to the complex for molecules that modulate the complexes can be used to indicate if the the complex has contact with the complexes can be used to indicate if the the complex has anti-neoplastic activity; is displayed, biseases which can cort using a test animal, in which tumour growth or regression is measured cor using a test animal, in which tumour growth or regression is measured to to test whether anti-neoplastic activity; is displayed, biseases which can be treated or prevented by molecule/s which modulate the function of the complex complexes and atherosclerosis and atherosclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 hsReq*-1; hsReq*-2; cyclin I; hyperproliferative disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New complexes of the cyclin-dependent kinase 2 protein with its interacting proteins, used to treat, e.g. atherosclerosis.
                                                                                                                           797 GAAGATAATGTCTCAGAAAATGTGGGTTCTGTGTGTGGCACT 838

```
CGCA), by detecting the level of expression of gene(s) (Gs) identified by DNA chip analysis as given in the specification, and comparing the expression level in an unactivated GC, where differential expression of Gs is indicative of GCA. Also included are differential expression of Gs is indicative of GCA. Also included are modulating (M2) GA by contacting GC with an agent that alters the capable of modulating GCA or an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to pathogen or sterile inflammatory disease using the gene expression to pathogen or sterile inflammatory disease, by detecting the level of pathogen or sterile inflammatory disease, by detecting the level of spression in a sample of the tissue of gene(s) from Gs, where the level of expression in a sample of the tissue of gene(s) from Gs, where the level of caparession of the gene is indicative of inflammation; (4) treating (M3) an inflammation; (4) treating (M3) an inflammation; or in a tissue, an allergic (M3) an inflammation of a subject to a pathogen or sterile
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detecting granulocyte activation by detecting differential expression of genes associated with granulocyte activation, which serves as diagnostic markers that is useful for monitoring disease states and drug toxicity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to detecting (MI) granulocyte (GC) activation
                                                                                                                                                                                                             Human; ss; granulocytic cell; DNA chip; bacterial infection, viral infection; parasitic infection; protozcal infection; fungal infection; sterile inflammatory disease; psoriasis; rheumatoid arthritis; glomerulonephritis; asthma; thrombosis; cardiac reperfusion injury; renal reperfusion injury; ARDS; adult respiratory distress syndrome; inflammatory bowel disease; Crohn's disease; ulcerative colitis; periodontal disease; granulocyte activation; chronic inflammation; allergy.
                                                                                                                                                                       Human cDNA differentially expressed in granulocytic cells #243.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Vockley J;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Yamaga S,

Classifying an ovarian tumor as a BRCA-1-like or BRCA-2-like or non-BRCA-like tumor by determining a pattern of expression in the ovarian tumor of several markers.

Disclosure, SEQ ID NO 234; 137pp; English.

The invention relates to a method of classifying an ovarian tumor as a BRCA-1-like or BRCA-2-like or non-BRCA-like tumor by: (1) determining a

pattern of expression in the ovarian tumor of several markers given in the specification; and (2) comparing a similarity of the pattern of expression of the markers in the ovarian tumor to a pattern of expression of the markers in a comparison tissue of a known BRCA-1-like or BRCA-2-like tumor. The method is useful for classifying an ovarian tumor as a BRCA-1-like or BRCA-2-like or non-BRCA-like tumor. This sequence corresponds to an ovarian cancer -related gene having an altered pattern of expression in ovarian cancer. (Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from MIDO at ftp.wipo.int/pub/published\_pct\_sequences) 88888888888888

A composition comprising a plurality of cDNAs, useful for detecting altered expression of genes in an immunological response or for diagnosing and treating an immunopathology, e.g. Crohn's disease, asthma or osteoarthritis.

SEQ ID NO 899; 50pp; English.

The invention relates to a composition comprising a plurality of cDNAs for detecting the altered expression of genes in an immunological response. The invention also relates to a method of diagnosing or monitoring the treatment of an immunopathogical condition in a sample, comprising obtaining nucleic acids from a sample, contacting the nucleic acids of the sample with an array comprising the plurality of cDNAs under

```
hybridisation complexes correlates with the presence of an invariant complexes correlates with the presence of an invariant complexes correlates with the presence of an immunopathological condition. Also disclosed are an expression profile comprising a microarray and a plurality of detectable complexes and a comprising a microarray and a plurality of polynuclectide probes. The cDNAs are useful as hybridisable array elements in a microarray can be used in the diagnosis of an immunopathology, such as Crohn's disease, asthma, clerative colities, hypereosinophila; irritable bowel syndrome, cetecarchritis, rheumatoid archritis or acute monocytic leukaemia, and in identifying agents for the treatment of the diseases The microarray may calso be used in drug discovery and development, toxicological and carcinogenicity studies, forensics or pharmacogenomics. The composition may also be used in purification of a subpopulation of mRNAs, cDNAs or mention. Note: The sequence represents a human cDNA of the printed specification but was obtained in electronic format directly
detecting the

Classifying a breast cancer patient according to prognosis comprises determining the similarity between the level of expression of each of five genes in a cell sample taken from patient, to control levels.

Disclosure; SEQ ID NO 1326; 226pp; English

```
according to prognosis by determining the similarity between the level of expression of each of five genes for which markers are listed in the specification, in a cell sample taken from the breast cancer patient, to control levels of expression for each respective five genes to obtain a patient similarity value. The methods are useful for classifying a breast cancer patient according to prognosis. Afts and computer program products are useful for data analysis using the diagnostic, prognostic and statistical methods of the invention. This sequence corresponds to a marker used in the method of the invention.

Human cyclin I protein and related (anti:sense) DNA - used for neuron labelling method and cancer cell detection.

Example 1; Fig 1; 45pp; Japanese

This sequence encodes human cyclin I. Antisense polynucleotides are useful for as probes and can be labelled and used for detection of meurones by hybridisation with mRNR for cyclin I (contained in the neurones and arising by the expression of the cyclin I gene in these cells). The gene can be used for detection of cancer cells by detecting the expression of the cyclin I gene in these specific for the fragments of the protein (especially ANX1966) can be used for detection

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Description

Sequence 29894, Application US/09513999C

Sequence 29894, Application US/09513999C

Patent No. 6783961

GENERAL INFORMATION:

APPLICANT: Duclert, A.

APPLICANT: Glordano, J.Y.

TITLE OF INVENTION: Expressed Sequence Tags and Encoded Human Proteins.

Patent No. 6783961

FILE REFERENCE: 59.US2.REG

CURRENT APPLICATION NUMBER: US/09/513,999C

Sequence 124453, Application US/09949016

patent No. 6812339

GENERAL INFORMATION:

APPLICANT: VENTER, J. Craig et al.

TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF

TITLE OF INVENTION NUMBER: 60/241, 755

PRIOR APPLICATION NUMBER: 60/241, 755

PRIOR APPLICATION NUMBER: 60/231, 498

PRIOR PILING DATE: 2000-10-03

PRIOR PILING DATE: 2000-09-08

NUMBER OF SEQ ID NOS: 207012

SEQ ID NO 124453

SEQ ID NO 124453
                                                             APPLICATE VENTER, J. Craig et al.

JITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF

TILE PEPERRENCE: CL001307

CURRENT PILING DATE: 2000-04-14

PRIOR APPLICATION NUMBER: 60/241,755

PRIOR PILING DATE: 2000-10-03

PRIOR FILING DATE: 2000-10-03

PRIOR FILING DATE: 2000-09-08

NUMBER OF SEQ ID NOS: 207012

SEQ ID NO 29572

LENGTH: 601
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length:

/clone lib="Human fetal heart, Lambda ZAP Express"
/note="Vector: Lambda ZAP Express; Site 1: EcoRI; Site 2: Xhol; mRNA was purified from human fetal hearts (8-10 weeks). CDNA was synthesized using a Xhol-Oligo dT adaptor-primer. EcoRI adaptors were ligated, followed by digestion with Xhol, for directional cloning into predigested lambda ZAP Express."

AA778982 27 05-FEB-1996 ac37f07.81 Stratagene hNT neuron (#937233) Homo sapiens cDNA clone IMAGE:858661 3' similar to TR:Q14094 Q14094 CYCLIN I. ;, mRNA
the Not I and Eco RI sites of a modified pT7T3 vector (Pharmacia). The retinas were obtained from a 55 year old Caucasian and total cellular poly(A) + RNA was extracted of the after their removal. The retina RNA was kindly provided by Roderick R. McInnes M.D. Ph.D. from the University of Toronto. Library constructed by Bento Soares and M.Fatima Bonaldo. "

1 (Dases I, Toppo, T., Caldara, F., Pacchioni, B., Pallavicini, A., Pandolfo, D., Toppo, S., Trevisan, S., Scarso, S. and Valle, G. Identification of 4370 expressed sequence tags from a 3'-end-specific CDNA library of human skeletal muscle by DNA genome Res. 6 (1), 35-42 (1996)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (5'-biotin-AACCCGGCTCGAGCGGCTTTTTTTTTTTTTTT-3'). The ds cDNA was sonicated and size-selected in the range 350-550 bp. The 3' specific fragments were selected by streptavidin coated magnetic beads, ligated on non-palindromic BstXI adapters, NotI digested and directionally cloned into BstXI-NotI cut pcDNAII vector."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              at
